

Before graduating in Nursing in 2021, what I wanted to study was Computer Engineering, opposite poles, I have always maintained this passion for technology having self-directedly created personal projects in Python and C#.

My professional journey began at the national health line, SNS24, this fundamental experience sparked my interest in the intersection between nursing and technology, a first contact with E-health and Telemedicine.

Having moved to Germany, this international experience has been enriching, but it has also made me realise that there is vast room for progress in the digitalisation of healthcare in this country.

I firmly believe that digital transformation is crucial for the future of global healthcare. Not only does it improve access and the efficiency of care, but it also allows for continuity of care regardless of the patient's location.

By joining this master's programme, I hope to acquire advanced skills and knowledge that will enable me to lead digitalisation initiatives in healthcare. I intend to explore not only the technical opportunities, but also the ethical and regulatory implications of this transformation. With this master's degree, I aim not only to boost my personal career, but also to contribute to the advancement of the healthcare sector on a global scale.

I feel it's the perfect opportunity to finally combine my field of study with the area I've always been passionate about.
