

STEFANO
DALMIANI

Dear,

In the 25 years of experience in the eHealth field, developing EHR systems, redefining how a healthcare process can benefit from a pervasive support from IT, I have realized that the learning curves never ends. This is due to multiple factors, sometimes very representative of medicine: evolutions in the medical field, with new discoveries, new drugs, new techniques and examinations, leading to new or upgraded/simplified healthcare process, but also evolutions on IT, from new devices to the latest application of AI, and the consequences in the real world, from cyberattacks to the application of new regulatory schemas.

When Henrique (Martins) signalled me this master I've noticed the wide range of relevant topics covered, and I recognized in those some complements and updates in my skills and knowledge.

The acquisition of these knowledges will help me to improve my competences applied in my job as a researcher, and head of research unit, with a wider connection with the many aspects that makes the eHealth domain so complex and interesting, empowering also innovation aspects in my future projects/proposals that includes these new dimensions.

I am aware that my application might have less priority than another presented by a younger or less skilled applicant, and I totally agree on that policy because I am supporting the growth of young researchers and professionals in the digital health field as well, but if you have some available position left I'll be glad to take it.

Looking forward to hear from you.

Kind regards.

Stefano Dalmiani.
