

It's great to see a Master's program that specifically addresses the intersection of healthcare, technology, and management. The emphasis on practical skills like planning, implementation, interoperability, and application development will undoubtedly make graduates highly valuable in today's rapidly evolving healthcare landscape. I believe ManagiDiTH aims to bridge the gap between different disciplines to foster effective digital transformation leaders in health. I am interested in learning more about specific aspects of the program and how such skills are being applied in the Greek healthcare system.

After many years as Director of Cardio-oncology, I've witnessed firsthand the growing need for digital solutions to improve patient care, streamline workflows, and enhance communication within the cardiology-oncology unit and across the cancer hospital. I believe that digital transformation could range from optimizing patient data management, improving remote monitoring capabilities for cardiac patients undergoing cancer treatment, enhancing communication between cardiology and oncology teams, to implementing AI-powered diagnostic tools. Additionally, I could gain the skills to ensure better interoperability between cardiology systems and the broader hospital infrastructure, leading to more efficient and integrated care.

Considering my experience in a cancer hospital, my interest in ManagiDiTH likely stems from a desire to strategically leverage digital tools to enhance patient care, improve operational efficiency, and position my institution at the forefront of healthcare innovation in the digital age. The program's comprehensive and healthcare-focused approach appears to be a strong fit for my ambitions. Becoming a Digital Transformation Leader could be of great value, as it would help me mentor junior colleagues and other healthcare professionals on the importance and implementation of digital health solutions. It would also allow me to contribute to research in cardio-oncology fields, leading to advancements in patient care.

Your Sincerely, Lafaras Christos MD, PhD,

Director of Cardiology, Theagenion Cancer Hospital, Thessaloniki, Greece
